

CLAIMS

1. A device for facilitating the formation of a blank of dough into a predetermined size, shape and configuration comprising in combination:

5 a base ring having an outer periphery and an inner aperture therethrough with the aperture being configured to correspond with the desired size and configuration of the blank to be formed in the device, the base ring having a thickness corresponding to the thickness desired for the blank.

2. The device of claim 1 further including a first inner ring having an outer periphery substantially conforming to the periphery of the aperture through the base ring and having an
10 aperture therethrough commensurate in size and shape to a blank of dough to be formed in the device.

3. The device of claim 2 further including a second inner ring having an outer periphery corresponding generally to the size and configuration of the aperture through the first inner ring and having an aperture therethrough of a size and configuration commensurate with a
15 blank of dough to be formed therein.

4. The device of claim 3 wherein the thickness of the first and second inner rings is the same as the thickness of the base ring.

5. The device of claim 4 wherein the aperture through the base ring, the first inner ring and the second inner ring are all circular in configuration.
